

## VUE.JS FRONTEND DEVELOPER I TAKE-HOME CHALLENGE

We're happy to invite you to the next stage of the engineering interview process. Please, access the challenge through this link: <https://github.com/iubenda/public-files/blob/main/js-assessment/archive.zip?raw=true> and by using the following password: `UrDpvLNd9zhQLozZmsxUv!n2`

Instead of building something dull and unrelated to what we do here in iubenda, let's create a simplified version of one of our products: our Cookie Solution Configurator (from now on "CSC").

The CSC is a SPA written in Vue/Vuex. It allows to create & adjust a configuration in JSON format based on multiple preferences selected by the user. You can see and test the live application on our website at the following

link: [https://www.iubenda.com/en/cookie\\_solutions/new](https://www.iubenda.com/en/cookie_solutions/new).

### What we'd like you to do

#### 1. FUNCTIONAL REQUIREMENTS

The attached archive contains a very simple rough scratch of the CSC app that doesn't use either Vue/Vuex or any other 3rd party dependencies except jQuery. As a result of your work, we'd like to see basically the same functionality (no regression) written in Vue/Vuex and any other dependencies/plugins that you consider as an improvement to the app, but without using jQuery (**even though it might seem overkill for such a small application, the Vuex store is mandatory** since we want to test your understanding of it, having our daily work a much bigger scope).

In addition to this, please, implement the following improvements/new features:

1. The current code is written with ES5 syntax, but please feel free to use ES6 and any related features that are supported by the majority of modern browsers (no IE);
2. Assume that the server will only be able to handle a JSON structured like the object specified in the `configDefault` variable, but all the properties are optional;
3. Create a UI section to handle the `banner` properties that you can find in the `configDefault` variable in the provided code;
4. Italian law requires that users should be able to deny consent to the usage of cookies by a button in the banner and that the close button of the banner cannot be used to accept the consent of the usage of cookies, so display in the UI a warning message `Your selected settings are not compliant with laws in Italy when:`
  - a. `targetCountries` is `'EU'` or `'world'`
  - b. and any of the following is true:
    - i. `banner.closeButtonDisplay` is `true` and `banner.closeButtonRejects` is `false`
    - ii. `banner.rejectButtonDisplay` is `false` and `banner.closeButtonDisplay` is `false`
    - iii. `banner.rejectButtonDisplay` is `true` and `banner.closeButtonDisplay` is `true` and `banner.closeButtonRejects` is `false`;

5. Both Italian and French laws require that the user should be able to express a preference on the usage of cookies only by

explicit interaction with the banner, so display in the UI a warning message Your selected settings are not compliant with laws in France and Italy when all of the following are true:

- a. `targetCountries` is 'EU' or 'world'
  - b. `consentByScroll` is true;
6. French law requires that the user should be able to express a granular preference for all the purposes for which the cookies are used, so display in the UI a warning message Your selected settings are not compliant with laws in France when all of the following are true:
- a. `targetCountries` is 'EU' or 'world'
  - b. `perPurposeConsent` is false.

## 2. NON-FUNCTIONAL REQUIREMENTS

Non-functional requirements are as much important as functional ones. Make sure that your solution has the following:

- Tests (e.g., using karma);
- Code linters configured (e.g., ESLint/SASSLint);
- A complete setup of npm dependencies and scripts same as you are ready to ship the app to production (meaning a minimized bundle);
- Includes a Readme.md file (think of it like the description you write on a GitHub PR) which outlines:
  - how to set up and run the application;
  - how to set up and run automated tests;
  - unsolved problems, if any;
  - design decisions;
  - suggested improvements;
  - how much time it took and what you would have done given more time.

## 3. OPTIONAL TASKS

If you got more time or you feel like doing it, you can also work on these additional improvements:

1. Save button should be interactive only if the config has been changed;
2. Implement a Reset button that will be available/enabled in case the config has been changed and it'll revert the data to its initially loaded state;
3. The UI should be non-interactive during HTTP requests;
4. Only configuration values that are different from default ones (see `configDefault`) should be saved on the server.
5. The server might return an error, which is nice to show somewhere;
6. It's not a requirement for this assessment, but if you feel like improving the style of the app, that's more than well-accepted (in case you intend to work on the style as well, here's a tip: only write the barely minimum CSS required to have the UI functional, and leave the graphical improvements to the very last part of the assessment as we're more interested in understanding how you structure the code and how you translate written requirements into the software).

## How to score

The bulk of our score comes from how you completed the **functional and non-functional requirements**.

We also evaluate the following:

- How simple and optimized your code is;
- Not over-engineering but yet extensible design;
- Good names of components, variables, and files;
- Nicely organized modules structure;
- Meaningful commits;
- Not spending way too long on it (we expect the assessment to take about 4 hours, but don't think of it as a constraint).

Use all the tools you need to ensure quality is up to your standards, and once done, **please, make sure to keep the GitHub repository private and send us your results via email (zipped .git repository)**. We will keep ourselves available to answer any questions you may have.

We take this chance to thank you in advance for all the effort you will want to put into this test!

Sincerely,  
iubenda Hiring team
